

ABSTRACT OF THE DISCLOSURE

[297] The present invention, the collapsible general-purpose dry cargo container consisting of component frame panels, is directed to the empty general-purpose dry cargo container repositioning in the logistics industry. The empty general-purpose dry cargo container repositioning involves operations similar to the loaded one during its transportation from one location to another, therefore is costly. The collapsible general-purpose dry cargo container is designed to reduce the empty general-purpose dry cargo container repositioning by converting the collapsible general-purpose dry cargo container itself into cargo to be shipped during the empty general-purpose dry cargo container repositioning; thereby reducing the empty general-purpose dry cargo container repositioning costs. Another benefit of the present invention is directed to reduce the space demand in container yard by storing the collapsible general-purpose dry cargo container frame panels in the disassembled state until needed.
